

Testing

Providing safe access to elevated worksites requires thorough quality and stability testing. Our state of the art hydraulic test ramp is capable of testing all possible access platform vehicle combinations for vehicles up to 36 T GVW on a slope of up to 10° longitude and latitude. The stability testing is conducted in compliance with both EN 280 and ANSI standards.

Every access platform vehicle leaving our facilities is thoroughly tested at a cage capacity of 150 % of the maximum capacity in the most demanding positions to ensure operator safety. All welds, bearings, rotations, tubes etc. is inspected after the stress test to guarantee the product will meet and exceed your expectations.

Demo

Specifications and product images are only capable of sketching a rough outline of what a Versalift access platform is all about. You have to experience one first hand to get the full picture.

TIME has several Demo vehicles that will allow you to see, feel and try a Versalift in action.

Our Demo fleet is attending trade shows and exhibitions all over Europe as well as touring the roads on large scale road shows - and you are of course always welcome for a demonstration at our Headquarters in Farsø, Denmark.
